Revision History

Version	Author	Issue Date	Changes
1	Sydney Trains	12/2/2013	Initial version
2	Sydney Trains	06/09/2014	Updated for TripUpdates GTFS Static Bundle Changes
2.1	TfNSW	18/09/2014	Formatted into standard report template. Consolidated access and tech document into one primary document
2.2	Sydney Trains	11/12/2014	Updated GTFS reference and added headsign information.
2.3	Sydney Trains	04/03/2016	Included charter services (section 2.2.1 and 2.2.4)
2.4	TfNSW	16/03/2016	Revised for Open Data
2.5	Sydney Trains	10/07/2018	Updated the Train Set type to support changes for Waratah Series 2 services and changes to Charter Trip ID range.
2.6	TfNSW	23/07/2018	Formatting and Waratah 2 shorthand added
2.7	Sydney Trains	05/09/2019	Updated Charter Trip_ID range
2.8	Sydney Trains	14/01/2019	Updated set types for NIF
2.9	Sydney Trains	10/01/2020	Updated Section 2.2.2. Train Set Types
3.0	TfNSW	27/07/2020	Updated Section 3.1 Coverage
3.1	TfNSW	23/10/2020	Additional Charter trip_IDs added, Indian Pacific set type removed
3.2	TfNSW	10/12/2020	Added Vehicles Extension and the corresponding Appendix B

1   GTFS Bundle Notes

1.1 agency.txt

Trains run by both Sydney Trains & NSW Trains will be contained within the bundle.

Times for NSW Trains running beyond the intercity network area (bordered by Goulburn, Bathurst, Scone, Dugong and Nowra) will not be accurate beyond these stations.

1.2 trips.txt

1.2.1   trip_id

The trip_id used to uniquely identify trips has a semantic content that could be used to provide additional information about the timetabled train. The format is as follows:

<trip_name>.<timetable_id>.<timetable_version_id>.<dop_ref>.<set_type>.<number_of_cars>.<trip_instance>

e.g. '123J.1171.00000102.124.T.8.0'

The bundle contains trips scheduled for operational and scheduling purposes. Trip_names reserved for Charter services should not be displayed to customers (e.g NH01). Hardcoding this rule is not recommended.

The following series for trip_name are reserved for Charter services:

Reserved Charter Run Numbers	Area	Description
880[A-Z] – 899[A-Z] e.g. 890A	Suburban	
HH01 - HH99	Intercity (Metro)	Trains operating between Metropolitan area locations - private Hire
NH01 - NH99	Intercity North	Additional trains between Sydney and Newcastle Interchange – Private Hire
WH01 - WH99	Intercity West	Additional trains between Sydney and Lithgow – private hire
CH01 - CH99	Intercity Illawarra	Additional trains between Sydney and Pt Kembla/Kiama- private hire

Trips with route RTTA_REV and RTTA_DEF should also not be displayed to customers. They are non-revenue services and trips that are not matched to a valid route.

<timetable_id>.<timetable_version_id>.<dop_ref> represent the calendar, so could provide indications the bundle is out of date if values in real time feeds do not match bundle calendar values.

The fields *<timetable_id>.<timetable_version_id>.<dop_ref>* within the trip_id is not recommended for use. This is reserved to keep the trip id unique.

1.2.2   Train Set Types

The following are the possible values that could be found in the *<set_type>* field of the trip_id for passenger trains.

Value	Train Set Type
A	Waratah
B	Waratah Series 2*
C	C Set
D	NIF
H	Oscar
J	Hunter
K	K Set
M	Millennium
N	Endeavour
P	Xplorer
S	S Set
T	Tangara
V	V Set (Intercity)
X	XPT
Z	Heritage & Private Passenger Operator

* "Waratah 2" is the approved shorthand to display in apps with limited real estate. Note that the preference is to refer to the full name "Waratah Series 2" whenever possible.

Other codes that could be encountered are:

Value	Train Set Type
G	Freight
I	Track Inspection
L	Lt Locomotive
O	Other
Q	Maintenance Track Machine
U	Bus
W	Fast Freight
Y	Other

1.2.3   block_id

The trips recorded in the GTFS bundle timetable include both trips running 'in service', as well as those running 'out of service'. A single trip could have both in service & out of service sections in its journey (Out of service sections must be at start and/or end of a trip).

Trips which are out of service for their entire journey can be identified as follows:

❖ All stops will have pickup �× , drop off ✕

Trips which are out of service for only part of their journey, can have their out of service sections identified as follows:

❖ Start – All stops from start of trip with pickup ✕, drop off ✕, till a stop with pickup ✓ is encountered.
❖ End – All stops working forwards from end of trip with pickup ✕, drop off ✕, till a stop with drop off ✓ is encountered

The Trip's block_id has been used to identify sequences of trips for which a passenger can remain on the train in continuous travel (both continuing in the same direction, or a turn-around service) as per the GTFS specification.

The following diagram seeks to show several of the scenarios around blocking, in service & out of service trips as well as the pickup drop off flags that may occur and what to expect. Shown is a single 'roster', representing a series of trips made by a single train in a day.
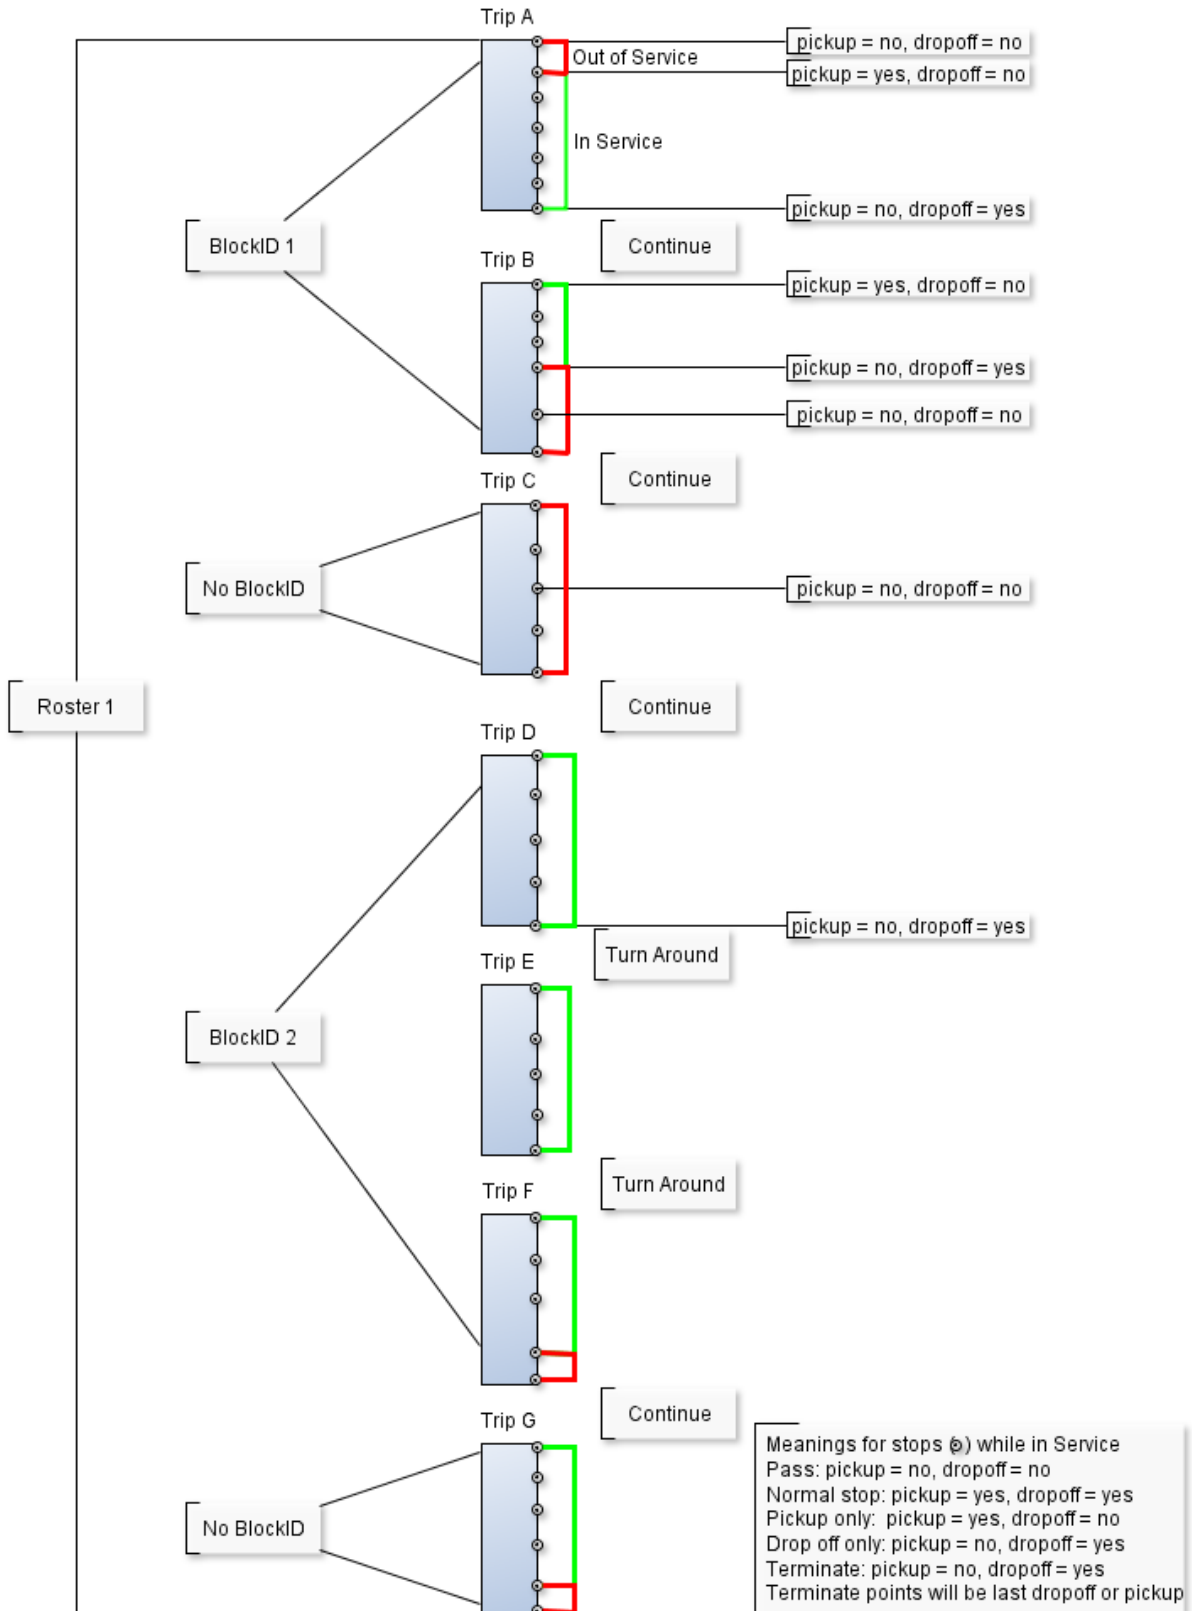

Figure 1-1 Blocking and Trip Example

1.2.4　trip_headsign

The trip_headsign is populated with destination for the passenger journey and is in the form *<Destination Station name>.*

The trip_headsign for a charter service is set to 'Charter'.

If a via station information exists then this is provided in the trip_headsign as *<Destination Station name>* via *<Via Station name>.*

If the headsign changes during a trip, an override is specified in stop_headsign field in stop_times.txt.

1.3　vehicle-categories.txt

Whilst it has not been officially adopted as GTFS standard yet, Transport for NSW has implemented the `GTFS-VehicleCategories` extension to improve public transport information for NSW. At this time, it is used for both suburban and intercity trains only.

This adds the file `vehicle-categories.txt` to the GTFS bundle which provides information about the vehicle categories. It contains two data elements, and these are:

`vehicle_category_id`　　　(ID, Required) It defines an ID for a vehicle category. If used along with the `GTFS-VehicleCouplings` extension, this field can be either a parent vehicle defined in `parent_id` or a child vehicle defined in `child_id`.

`vehicle_category_name`　　(Text, Optional) It defines the name of the vehicle category.

The `GTFS-VehicleCategories` describes the vehicles themselves. It also adds a new data field in the following core GTFS files:

> `routes.txt`
>
> `trips.txt`
>
> `stop_times.txt`

The new data field is the optional `vehicle_category_id` which defines a default vehicle category in `routes.txt` for all trips belonging to the route. This value is referenced from the `vehicle_categories.txt` file.

The optional `vehicle_category_id` defines a default vehicle category in `trips.txt` for the trip. It likewise defines a default vehicles category in `stop_times.txt` for the stop time.

The value of `vehicle_category_id` in either `routes.txt` or `stop_times.txt` can be overridden by the value of `vehicle_category_id` in `trips.txt`.

Below is an example of vehicle categories. For the complete list of vehicle categories, please refer to Appendix B.

vehicle_category_id	vehicle_category_name
T8	8-car Tangara
T4	4-car Tangara
Tcar	An individual Tangara car

1.4   vehicle-couplings.txt

The `GTFS-VehicleCouplings` describes the arrangement of vehicles in composed vehicles such as trains. This extension requires the `GTFS-VehicleCategories` extension and is another extension that Transport for NSW has implemented for both the suburban and intercity trains.

This also adds the file `vehicle-couplings.txt` to the GTFS bundle which defines the relationship between composed vehicles (e.g. train) and individual vehicles (e.g. carriages).

The file `vehicle-couplings.txt` added to the GTFS bundle contains four data elements, and these are:

`parent_id`	(ID, Required) It defines the hierarchy between the different vehicle categories specified in `vehicle_categories.txt`. This field contains the `vehicle_category_id` of the parent vehicle.
	(Note that only 3 levels of nesting are allowed. A parent vehicle is called a grandparent vehicle when its child vehicles are also defined as parent vehicles).
`child_id`	(ID, Required) It defines hierarchy between the different vehicle categories specified in `vehicle_categories.txt.` This field contains the `vehicle_category_id` of the child vehicle. Several child vehicles can be defined per parent vehicle.
	(Note that only 3 levels of nesting are allowed. A child vehicle is called a grandchild vehicle when its parent vehicle is also defined as child vehicle).
`child_sequence`	(Non-negative Integer, Required) I defines the location of the child vehicle in respect to the other child vehicles composing the parent vehicle. The order number must increase along the parent vehicle, from its head to its tail.
`child_label`	(Text, Optional) It is a short text that can be used to easily identify the child vehicle. This text may be printed or displayed on either the vehicle or the platform. If nothing is usually used to identify child vehicles, no values should be provided.

Example of Vehicle Couplings

parent_id	child_id	child_sequence	child_label
T8	Tcar	1	1
T8	Tcar	2	2
T8	Tcar	3	3
T8	Tcar	4	4
T8	Tcar	5	5
T8	Tcar	6	6
T8	Tcar	7	7
T8	Tcar	8	8

The example shown in the table above defines an 8-car Tangara (see `parent_id`). Each row corresponds to one individual car (see `child_id`) and the sequence of the cars showing which car is first, which car is second, and so on, is defined under `child_sequence.`

1.5   vehicle-boardings.txt

The `GTFS-VehicleBoardings` describes where the vehicle stops on a platform, i.e. which cars can be accessed from the platform. If the train is longer than the platform, some cars may not be accessible from the platform and this extension provides that information.

This is the third extension Transport for NSW has implemented for both suburban and intercity trains. The extension requires the `GTFS-VehicleCategories` extension, and optionally the `GTFS-VehicleCouplings` to use the `child_sequence` and `grandchild_sequence` fields.

This also adds the file `vehicle-boardings.txt` to the GTFS bundle which describes how to map the vehicles with the boarding areas of the platform.

The file `vehicle-boardings.txt` added to the GTFS bundle contains four data elements, and these are:

`vehicle_category_id`	(ID, Required) It identifies the `vehicle_category_id` which will stop in front of this boarding area.
	If using `vehicle_couplings.txt`, this field must match the `vehicle_category_id` of the grandparent vehicle, or the one of the parent vehicle if no grandparent vehicles are specified.
`child_sequence`	(ID, Conditionally required) It contains the `child_sequence` of a child vehicle. This field is useful when the same child vehicle appears multiple times in its parent vehicle.
	It is required if using `vehicle_couplings.txt`.

grandchild_sequence   (ID, Conditionally required) It contains a **child_sequence** of a grandchild vehicle. This field is useful when the same grandchild vehicle appears multiple times in its parent vehicle.

boarding_area_id (ID, Required) It represents the boarding area at which the vehicle will stop. This field references **stop_id** from **stops.txt**. The referenced object must have **location_type** of **4** or **5**.

Example of Vehicle Boardings

vehicle_category_id	child_sequence	grandchild_sequence	boarding_area_id
T8	8		2077291
T8	7		2077291
T8	6		2077291
T8	5		2077291
T8	4		2077291
T8	3		2077291

The example shown in the table above is an 8-car Tangara train stopping at Asquith Station Platform 1 (boarding_area_id of 2077291 is Asquith Station Platform 1). Note that only cars 3 to 8 are identified. The reason for this is that Asquith Station Platform 1 can accommodate 6 Tangara cars only. It is a short platform. Cars 1 and 2 will not have a platform. Customers will not be able to board cars 1 and 2. This is also an indication that the 8-car Tangara train aligns its rear with the platform. Cars 1 and 2 are front cars and these will not be accommodated to a platform.

2 GTFS-R Vehicle Position

2.1 Coverage

Vehicle coverage is provided for the Sydney Metro region, as well as the Central Coast & Newcastle Line, and South Coast Line to Kiama.

2.2 Non Timetabled Trains

The vehicle position feed can contain data for non-timetabled trains in addition to those in the GTFS bundle. Non timetabled trips will have a different trip id format as follows:

NonTimetabled.<trip_name>

2.3 VehicleID

The vehicle Id field has semantic content and is formed by a dot (.) separated list of the carriage identification numbers forming a train.

e.g. 7654.7655.7656.7657.8532.8533.8534.8535

These are carriage numbers which have been masked.

2.4 Example

```
entity {
  id: "6"
  vehicle {
    trip {
      trip_id: "128J.1171.00000104.124.S.8"
      schedule_relationship: SCHEDULED
      route_id: "WL_1b"
    }
    position {
      latitude: -33.864037
      longitude: 151.04587
    }
    timestamp: 1360750370
    congestion_level: UNKNOWN_CONGESTION_LEVEL
    vehicle {
      id: "1340.1341.1342.1343.1344.1345.1346.1347"
      label: "09:55:00 Central Station to Richmond Station Passenger
train"
    }
  }
}
```

3 GTFS-R Service Alerts

3.1 Coverage

Service Alerts are provided for the following categories:

- Line status – Generic information relating to current operation on a line. e.g. delays, track work

- Station facilities information – Information regarding lifts and escalator breakdowns / maintenance

- General station information – Other general messages relating to stations

- Trip information – messages regarding current state of specific trips. E.g. delays, cancellation.

3.2 Trip Based Service Alerts

Trip based Service Alerts are used to convey information around train running for that trip. These would generally be short messages related to delay announcements and reasons. When service levels (On time running) around the network degrade during disruption events, It is anticipated that individual trip delay style messages will reduce and be replaced by appropriate Line status messages regarding the disruption.

3.3 Examples

Line service alert information:

```
entity {
  id: "1"
  alert {
    informed_entity {
      agency_id: "SydneyTrains"
      route_id: "BL_1a"
    }
    url {
      translation {
        text: "https://transportnsw.info/alerts#/train"
        language: "en"
      }
    }
    header_text {
      translation {
        text: "Major Delays"
        language: "en"
      }
```

```
      }
      description_text {
        translation {
          text: "Signalling failure."
          language: "en"
        }
      }
    }
  }
}
```

Trip based alert:

```
entity {
  id: "3"
  alert {
    informed_entity {
      agency_id: "SydneyTrains"
      trip {
        trip_id: "12-E.1171.105.124.T.8"
      }
    }
    url {
      translation {
        text: "https://transportnsw.info/alerts#/train"
        language: "en"
      }
    }
    header_text {
      translation {
        text: "Trip Update"
        language: "en"
      }
    }
    description_text {
      translation {
        text: " Cancelled Due to electrical repairs."
        language: "en"
      }
    }
  }
}
```

Station facilities alert:

```
entity {
  id: "5"
  alert {
    informed_entity {
      agency_id: "SydneyTrains"
      stop_id: "200060"
    }
    url {
```

```
        translation {
          text: "https://transportnsw.info/alerts#/train"
          language: "en"
        }
      }
      header_text {
        translation {
          text: "Escalator Unavailable"
          language: "en"
        }
      }
      description_text {
        translation {
          text: "Platform 24/25 and ESR Concourse"
          language: "en"
        }
      }
    }
  }
}
```

4   GTFS-R Trip Updates

TripUpdates provide predicted arrival and departure time for stops along the trip. They also provide information for any changes done on the trip running on that day.

4.1 Coverage

TripUpdates are provided for the following categories:

- New trips – Insert Trip

- Any changes done on the trip running on that day. These are shown as a replacement. They typically include scenarios like Added Stops, Skipped Stops, Cancel Trip, Terminate Early, Change Start, Change Platform, Reroute Trip, Extend Trip, Hold Trip.

- Delays - For Time Predictions – delay in stop time updated is used to communicate arrival and departure delay in seconds to a scheduled GTFS Trip.

4.2   Examples

Insert Trip:

```
entity {
  id: "5566.617.130.32.C.2.0"
  trip_update {
    trip {
      trip_id: "5566.617.130.32.C.2.0"
      schedule_relationship: ADDED
      route_id: "NSL_1"
    }
    stop_time_update {
      arrival {
        time: 1409874540
      }
      departure {
        time: 1409874540
      }
      stop_id: "2000336"
    }
    stop_time_update {
      arrival {
        time: 1409874690
      }
      departure {
        time: 1409874750
      }
      stop_id: "2000393"
    }
    stop_time_update {
      arrival {
        time: 1409874846
      }
      departure {
```

```
        time: 1409874888
      }
      stop_id: "2000404"
    }
    stop_time_update {
      arrival {
        time: 1409875086
      }
      departure {
        time: 1409875116
      }
      stop_id: "206142"
    }
    stop_time_update {
      arrival {
        time: 1409875200
      }
      departure {
        time: 1409875260
      }
      stop_id: "2060104"
    }
    stop_time_update {
      arrival {
        time: 1409875356
      }
      departure {
        time: 1409875386
      }
      stop_id: "2060112"
    }
    stop_time_update {
      arrival {
        time: 1409875488
      }
      departure {
        time: 1409875518
      }
      stop_id: "2065162"
    }
    stop_time_update {
      arrival {
        time: 1409875632
      }
      departure {
        time: 1409875662
      }
      stop_id: "2065153"
    }
    stop_time_update {
      arrival {
        time: 1409875788
      }
      departure {
        time: 1409875818
      }
      stop_id: "206452"
    }
```

```
stop_time_update {
  arrival {
    time: 1409875932
  }
  departure {
    time: 1409875962
  }
  stop_id: "2067144"
}
stop_time_update {
  arrival {
    time: 1409876280
  }
  departure {
    time: 1409876310
  }
  stop_id: "207263"
}
stop_time_update {
  arrival {
    time: 1409876430
  }
  departure {
    time: 1409876460
  }
  stop_id: "2073162"
}
stop_time_update {
  arrival {
    time: 1409876598
  }
  departure {
    time: 1409876628
  }
  stop_id: "2074182"
}
stop_time_update {
  arrival {
    time: 1409876718
  }
  departure {
    time: 1409876748
  }
  stop_id: "2074192"
}
stop_time_update {
  arrival {
    time: 1409876832
  }
  departure {
    time: 1409876862
  }
  stop_id: "2076242"
}
stop_time_update {
  arrival {
    time: 1409876964
  }
```

```
          departure {
            time: 1409876994
          }
          stop_id: "2077312"
        }
        stop_time_update {
          arrival {
            time: 1409877114
          }
          departure {
            time: 1409877174
          }
          stop_id: "2077302"
        }
        timestamp: 1409851188
      }
    }
```

Replacement service:

```
    entity {
      id: "108B.617.130.124.T.8.0"
      trip_update {
        trip {
          trip_id: "108B.617.130.124.T.8.0"
          schedule_relationship: REPLACEMENT
          route_id: "NL_1a"
        }
        stop_time_update {
          arrival {
            time: 1409870700
          }
          departure {
            time: 1409870700
          }
          stop_id: "2000336"
        }
        stop_time_update {
          arrival {
            time: 1409870856
          }
          departure {
            time: 1409870916
          }
          stop_id: "2000393"
        }
        stop_time_update {
          arrival {
            time: 1409871012
          }
          departure {
            time: 1409871054
          }
          stop_id: "2000404"
        }
        stop_time_update {
          arrival {
            time: 1409871240
```

```
        }
        departure {
          time: 1409871270
        }
        stop_id: "206142"
      }
      stop_time_update {
        arrival {

5 Appendix A – Duplicate Sydney Trains and NSW Trains services

The following list of trips represents services that appear in both the Sydney Trains realtime feed and NSW Trains intercity and regional realtime feed. For consumers using both feeds, TfNSW recommends filtering out these services from the Sydney Trains feed and preferentially using the NSW Trains feed.

Diesel NSW Trains service (NP, NT, V, SN, SP, ST, WN, WP, WT, KN, CN

Diesel NSW Trains service (NP, NT, V, SN, SP, ST, WN, WP, WT, KN, CN)
